

ABSTRACT

ROTARY MACHINE

5 A rotary machine is disclosed having a rotor 11, a
stator 16, and blade rows 12, 14 on the rotor and stator
that impart a high swirl component to gases flowing through
the machine so that the denser impurities are deflected
radially outwards by centripetal action onto the inner wall
10 of the stator of the machine. A ramped guide surface is
provided on the inner wall 17 of the stator along which any
impurities separated by the centripetal action from the main
gas stream are entrained by the main gas stream and guided
to flow from the gas intake side to the gas outlet side of
15 the machine. The guide surface is radially stepped to resist
only reverse flow of the separated impurities back towards
the gas intake side of the machine and serves at the
downstream end of the machine to discharge the separated
impurities back into the main gas stream for the impurities
20 to exit from the machine with the main gas stream.
